

# LynxDispatcher

Radio Alert System

## Networked Radio

### Inputs

The LynxDispatcher can be activated by any of the Lynx system alarm input, including Desk top Icons, LynxKey Hot Keys software, LynxUSB hardwired USB panic buttons, LynxNet256 wireless panic button receiver, and the LynxNet hardwired input devices.

### Features

- Activate your radios remotely across campus or across the county
- Instant Radio dispatch using your existing radio system.
- Works with ALL radio systems
- AC powered
- 15 ft power cable
- Wall mounted
- Rugged Metal House  
6 3/4"(W)  
17 1/2"(H)(w/o antenna)  
3" (D)
- Requires the LynxGuide Server with sound card

The **LynxDispatcher** now allows any of your Lynx system alarms - software or hardware, to communicate to your existing radio system. The messages can be pre-recorded Wave files or you can use the built-in text to speech feature. Alarms that have been pre-setup can have a message in one of your employees voices key your radios. For applications with variables the alarm subject with the additional message is converted to speech and verbalized through your radio system. This works well for Code alerts with added instructions or alarms created using Macros that link the computer/employee data to the alarm.

When verbal messages that are sent to the **LynxDispatcher** for broadcasting, the carrier detect feature verifies a clear channel prior to broadcasting. Carrier detect wait time and Push to Talk time are programmable. A programmable message repeat can be selected for individual messages.

The **LynxDispatcher** is compatible with all radio system. Simply **provide one hand held radio** from your radio system. We build **your** hand held radio into the LynxDispatcher.
